

New Safety Sensor for Child Car Seats

By Davdon Enterprises

Dated: Nov 01, 2007

Product designed to save lives in extremely hot or cold conditions

Vancouver, Davdon Enterprises announced they have developed a pressure mounted sensor alarm for child car seats. The system is designed to never allow a parent to "forget" their child in the car seat especially on extremely hot or cold days. The product is easily installed and is activated by the weight of the child. On average, in the United States there are between 30 to 45 avoidable deaths per year as a result of children being left in unattended vehicles.

With several high profile deaths covered extensively by the media in recent months, company president Sean Donnelly is confident his product will save lives.

Davdon is now actively looking to licence this product to a single manufacturer or to sell through multiple distributors. For further information, please contact via email davdon@axion.net or phone (604) 221-2643

###

Davdon Enterprises is a strategic business development company. It works with firms to increase their revenue and also develops and markets specific products to the public.
