

Announcing the ASPxTreeList v2008 vol 2 beta, the Ultimate ASP.NET TreeView and ListView Hybrid

DevExpress technologies for Visual Studio help you build your best, reduce the amount of code you write, increase your productivity, and create stunning applications for Windows and the Web in the shortest possible time.

July 7, 2008 - [PRLog](#) -- Developer Express extends its award winning ASP.NET and AJAX enabled component collection with beta 1 of the new ASP.NET TreeView and ListView hybrid control - the ASPxTreeList Suite. Built from the ground up in C# and optimized for ASP.NET 2, the ASPxTreeList is a multi-purpose data visualization system that can display information as a TREE, a LIST, or a combination of both - in either data bound or unbound mode. This unique synergy between traditional data presentation formats allows you to create cutting-edge and visually appealing web application interfaces for your end-users with ease.

The ASPxTreeList fully exploits existing DevExpress appearance and data management technologies for ASP.NET. Features such as on-demand loading of individual nodes and AJAX callback support ensure that the solutions you build are both elegant and effective. In our implementation, the control never needs to transmit the entire tree structure when being updated. ASPxTreeList is smart enough to determine which portion of the tree is to be renewed and only requests a few records from the server, making user interaction lightning fast.

New capabilities introduced in this beta include:

- Built-in Data Editing UI
- Tree Node Validation and Error Indication Support
- Tree Node Drag and Drop Support

To download your free evaluation copy of the ASPxTreeList control along with our entire line-up of award winning ASP.NET presentation components for Visual Studio, visit our website at:
