

Amazon Web Services and aiCache team to bring the cloud home.

By Marvin Webers

Dated: Feb 18, 2009

aiCache web acceleration is now available on the Amazon Web Services. Companies looking to reduce cost, scale their web applications and bring stability to their environment can now front-end their websites using aiCache technology in the cloud.

aiCache web acceleration is now available on the Amazon Web Services platform. Companies looking to reduce cost, scale their web applications and bring stability to their environment can now front-end their websites using aiCache technology in the cloud.

aiCache stabilizes applications, by capturing traffic before it hits the web, application, and database servers. Cached requests are served instantaneously from aiCache reducing response time and removed load from the web-farm.

The availability of Amazon EC2 Proxy instances allows companies, for the first time, to move their traffic from their local data-center to the take advantage of the speed and stability of aiCache, while leveraging the world class infrastructure of Amazon.

Applications already on Amazon can immediately take advantage of aiCache by simply initiating the aiCache AMI from the Amazon Solutions Catalog.

aiCache uses KITE (Keynote Internet Testing Environment) an ideal free tool to validate and improve the performance of applications running on aiCache & Amazon.

The combination of Amazon's infrastructure, aiCache acceleration, and Keynote's global monitoring make a powerful tools-set for businesses needing scale, stability and cost reduction.

"We feel the Amazon Elastic Compute Cloud, with its ability to run the 64 Bit Linux instances, that make the aiCache technology possible, is the best of all possible worlds for on-demand growth. With Amazon billing, these instances can be configured for hours, weeks, or on a permanent basis, depending on the needs of our customers.

We created this service to allow set-up, testing, and validation, all without interruption of the existing application. We have made it easy to realize the advantages of virtualization and caching in the cloud. We look forward to helping customers build better, more scalable applications; the kind that let them spend their evenings with their families. -Max Robbins COO aiCache.

Amazon Web Services (AWS) provides technology services that give businesses access to Amazon's own back-end technology infrastructure that they can use to enable virtually any type of business. These in-the-cloud web services make it possible for any business to reach the scale of major internet players such as Amazon.com, but without the expensive price tag these companies must pay to build and maintain such reliable, secure, and scalable infrastructure. Businesses can use AWS to achieve this level of web scale with zero up-front investment and low, pay-as-you-go pricing. More than 290,000 developers have signed up to use AWS since its inception. Amazon Web Services LLC is an Amazon.com, Inc. company. More information is available at <http://aws.amazon.com>.

Keynote (Nasdaq "KEYN"), the global leader in on-demand test & measurement solutions for continuously improving the online experience, recently introduced KITE which provides real-time performance reporting from five global locations for FREE.
