

New Release: web2test version 1.2 - JavaScript bridge sets new standards for the testing of web apps

By itCampus

Dated: May 05, 2009

web2test is an innovative web test tool developed by itCampus. The new release offers almost unlimited opportunities for the implementation of test scenarios thanks to a full access (read and write) to the JavaScript objects of the web application.

Software developer itCampus has released version 1.2 of its innovative test software. The tool allows for automated, functional testing of web applications and supports most of the established browsers from Internet Explorer to FireFox and Seamonkey.

During the past few weeks the itCampus developer team has been working on several new features which greatly improve the testing using web2test.

This precisely means:

- A JavaScript bridge in the new version grants the user read and write access to JavaScript objects in the browser DOM and hence opens a variety of new possibilities for the implementation of test scenarios.
- Via "rc.setOption" the majority of the program options can be set during runtime for selected test cases or parts thereof. This greatly increases the flexibility of test cases.
- web2test now includes new standard procedures for checking CSS properties like color or font attributes.
- The support of modal dialogs has been enhanced.
- Furthermore web2test now offers a revised and extended documentation; thus two tutorial chapters – one for the testing of AJAX elements and one for ensuring correct prerequisites have been added.

Holger Flemig, main developer of web2test about the new version 1.2: "With the new JavaScript bridge and the new rc.setOption feature there are practically no more limits for the testing with web2test."

About web2test

web2test has been developed as a co-operation project between itCampus and Quality First Software (QFS). It is a tool for functional system tests of web based applications, portals and complex websites. Further USPs: Tests are platform and browser independent and tolerant towards layout changes. In addition web2test offers a real user simulation for a 100 % AJAX support. The test tool can be used under Windows as well as under Linux. <http://en.web2test.de>

About itCampus

itCampus is an innovative software development company closely cooperating with international scientists and researchers. Founded in 1999 in the cities of Halle and Leipzig in Germany, the company today has offices in Germany, the UK, Switzerland, Italy, Austria and Slovakia. itCampus provides communication solutions, IT consultancy services and custom solutions in the fields of software development and software ergonomics. Since April 1 2009 the Software AG is itCampus' majority shareholder. <http://www.itcampus.de>
