WATERPROOFING, epoxy injection, epoxy injection pump, waterproofing basement, Grouts, Resins, Gels, Polyurethanes, Epoxies, Equipment, Pumps, Specialty Coatings

There are two ways to waterproof an existing, underground basement.

The most familiar is commonly referred to as cellar or basement tanking. It is also known as resistive waterproofing and, as its name suggests, waterproofs by resisting the ingress of water from the ground into the structure. It is quite effective if professionally applied and is totally reliant on the strength of the building. However, because it is so hard, it has a tendency to crack under vibration from heavy road traffic or movement in the structure

Homepros Waterproofing is the Canadians leading waterproofing and damp proofing applications specialist in new build construction, building renovation & refurbishment projects- Whether you need a basement waterproofing, cellar waterproofing, lining a tunnel or waterproofing an arch, underground waterproofing waterproof membrane property care association cellar waterproofing building renovation epoxy resin damp proof courses vaults manufacturing company chemical manufacturing tanking product development

Epoxy Injection
Construction Forensics and Remediation Evaluation
Environmental Containment
Air Quality Purification and Cleaning

Parking garages are subjected to a number of conditions whether they are constructed above or below grade. Although very tough, concrete is susceptible to deterioration. Corrosion occurs when moisture and salts seep through cracks and defects in the concrete slabs. This can result in the accumulation of rust on the reinforcing steel. If unmonitored, the structural capacity of the garage can be significantly compromised. Waterproofing parking garage membranes prevent water penetration through the structure, and ultimately protect the vehicles and mechanical/electrical equipment inside. Membranes also keep water/moisture away from the concrete thereby preventing the corrosion of the reinforcing steel. Because waterproofing membranes are installed to protect the concrete, they are exposed to the same environmental conditions as the concrete. Membranes are also exposed to the effects of structural movement and vehicular and pedestrian traffic. As such, it is critical that the membranes be routinely examined for signs of deterioration and wear.
