HVR Advanced Power Components Awarded ISO 9001:2000 Certification

HVR Advanced Power Components, Inc. (HVR) (www.hvrapc.com), a leading global supplier of engineered, high-energy, ceramic-carbon resistors, has announced that they have achieved ISO 9001:2000 certification for the design, assembly and distribution of electronic resistors.

The certification was awarded following a comprehensive, independent audit by SRI Quality System Registrar of Pittsburgh, Pennsylvania. Audit findings determined that HVR has demonstrated effective implementation of a world-class quality management system at their Tonawanda-based manufacturing facility.

Notes company president, David J. Yanko, "We are pleased that our commitment to excellence in all aspects of our organization has been recognized by the registrar. We hope that this certification shall reaffirm to our customers, employees, distributors and the community our firm commitment to continuous quality improvement across all facets of HVR's business operations."

Added Ron Wills, Quality Assurance Manager, "The full commitment, participation and effort of our team were among the most critical elements to achieving certification. Our future plans involve further improvements to our Quality Management System, and transition from ISO 9001:2000 to ISO 9001:2008 by May 2010."

The ISO (International Organization for Standardization) is the source of the ISO 9000 and ISO 14000 families of internationally recognized quality and environmental management standards. ISO-registered companies adhere to strict guidelines to ensure that processes that influence product and service quality maintain the highest possible standards. The standards are applied worldwide, and are widely accepted as evidence of a company's credibility as a manufacturer in the global marketplace.

###

About HVR Advanced Power Components, Inc.:

Founded in 1991, HVR Advanced Power Components, Inc., is a privately held, North American affiliate to HVR International Limited of Jarrow, England, and a leading supplier of engineered, high-energy resistors. Resistors act within electrical circuits much like the brakes of a car, providing control by turning excess energy into heat. Most resistors are low-cost components, and considered a commodity in electronics world. One of HVR's specialties is a special type of resistor, designed to operate under extreme conditions, in higher-power systems. HVR customers apply their custom-engineered components to Medical Electronics, High Power Energy Conversion, Physics Research and Military applications.
