

Male Infertility Supplement Successful in Enhancing Male Fertility and Healthy Sperm Counts

Proceptin is a male fertility supplement to created by a leading San Diego fertility doctor to help men with infertility establish healthy increased sperm counts and increase the chances for having children

July 5, 2009 - [PRLog](#) -- In the United States nearly 2 million men deal with infertility issues when trying to have children. (Incidence (annual) of Male infertility: at least 2 million annual cases (based on NWHIC).

One new male fertility supplement created by a leading San Diego fertility doctor is helping men increase healthy sperm counts and thus their chances for having children by using data from over 60 research studies on the subject of male infertility.

When it comes to having children and starting a family a man not only needs a high sperm count but also a healthy sperm count. That is the basis of a new male fertility product called Proceptin, which not only increases sperm counts but more importantly increases "health" sperm counts.

Developed by Dr. Steven A Brody, the use of nutritional supplements such as Proceptin®, with the proper antioxidants may reduce the adverse effects of oxidative stress on reproductive tissue and organs, and potentially improve sperm function.

Proceptin is the first physician-formulated preparation. It has been formulated to provide many of the nutrients which have been shown to support successful male reproductive function. It has been developed as a result of over 60 research studies addressing the role of antioxidants, and amino acid precursors in male reproductive function.

Proceptin is the only product of its kind containing the potent antioxidant Pycnogenol. Pycnogenol as well has been proven to improve parameters on semen analysis. Additionally it contains high doses of carnitine, CoQ-10, selenium & zinc, vitamins C, E, and B complex. Proceptin is recommend for men, when couples are trying to have a baby.

Proceptin is a nutritional supplement that does not contain any herbs or preservatives. Each component in Proceptin has been verified in clinical studies published in leading medical journals.

Infertility in Men

In the past it was considered necessary to address the reproductive function of a man only if his sperm count was found to be low. However, It is now known that count is not the only factor in impaired fertility cases, motility and morphology also play a major role in a man's ability to fertilize.

A man with fewer than 5 million sperm per milliliter of semen is often infertile. A sperm count below 20 million is considered low. In these cases the men might be sub-fertile or infertile. However, it should be understood that a man can be sub-fertile even if he has a normal sperm count of between 20 and 250 million sperm per milliliter of semen.

The sperm's ability to move is referred to as motility. The most successful sperm are those that are able to move forwards rapidly. Rapid motion forward is defined as a sperm that is able to travel at least half its length in one second. Often times, sperm are found to lack this essential aspect of motility and they end up swimming slowly or in the wrong direction, some even swim in circles. The sperm's ability to move correctly is directly linked to its shape.

The morphology of sperm is the third key factor in evaluating the role of abnormal sperm cells. A normal sperm is made up of a head, a mid piece and a tail. A normal head is oval in shape and can be easily distinguished from the mid piece. The mid piece should have approximately half to three quarters the area of the head. And the tail should be around four or five times the combined length of the head and mid piece. When variation in just one of these areas occurs, a sperm's chance for success is greatly reduced as a miss-shapen head or a deformed tail can cause the sperm to be a weak swimmer or to be incapable of maintaining a straight path.

If you are a man who is looking for a fertility supplement and seriously considering having children visit the www.Proceptin.com website for more information on at www.Proceptin.com

###

Proceptin was developed by Dr. Steven A. Brody in San Diego, a leading fertility doctor who went through over 60 research studies on male infertility to develop a supplement that would increase healthy sperm counts in men.

Assisted fertilization is used for cases of severe male factor infertility associated with very low sperm counts, or sperm counts with very low proportions of moving sperm cells. Sperm cells may be placed directly into the egg itself by a process known as intracytoplasmic sperm injection (ICSI). Prior to the success of ICSI sperm cells were placed just inside the protective shell surrounding the egg to facilitate fertilization know as sub-zonal insertion (SUZI).

For more information on developing healthy sperm counts visit the Proceptin website at www.Proceptin.com
