

Tree Top Builders Hosts First Tree House Building Workshop

West Chester, PA September 23, 2009 – Tree Top Builders, a custom tree house building company, hosted their first tree house building workshop in West Chester, Pa on September 18-20, 2009.

Sept. 23, 2009 - [PRLog](#) -- Tree Top Builders' first tree house building workshop was a huge success! Attendees travelled great distances (including one from Canada!) to attend this informative, three-day session on the best practices of tree house construction and tree house accessory installation.

Although most of the tree house workshop was “hands-on”, participants also learned about the theory that goes into building better tree houses. They observed and installed tree house fasteners, built a 17' high tree house platform on four garnier limbs mounted to three trees. We also installed a 130' zip line from the tree house platform to the ground.

Most importantly, all workshop participants left more prepared to adequately select a tree house site, design their project, properly install professional tree house fasteners, and work safely in the trees.

The workshop went from Friday, September 18 through Sunday, September 20, meals were included.

Specific topics covered in the workshop included:

Tree Biology

We learned about compartmentalization, pruning, how to know if a tree is healthy, and how to choose a good tree or set of trees for a treehouse.

Treehouse Fasteners

A presentation on treehouse fasteners. We had a lively discussion about the pros & cons of various fasteners such as garnier limbs. In a later session, many people took turns drilling and/or installing several garnier limbs and large lag bolts

Climbing & Rigging

Participants were educated on a few of the climbing and rigging techniques we use here at Tree Top Builders. Speed and efficiency do matter, but they never take priority over safety while working in and near trees.

Tree House Design

Also covered were the basics of treehouse design. There are often different ways to support the same treehouse platform. The pros & cons of various designs are discussed. In the end, however, a proper design must incorporate the spacing and size of each tree, the requirements of the end users, and the particular aesthetic appearance that is most fitting with the surroundings. Treehouse design is very artistic but must not stray from a working knowledge of lumber spanning charts.

Zip Line Design

After setting up and testing a 130' zip line, we reviewed the principals of sag, pitch, and span as they relate to staying within the safe working limits of aircraft cable. The course earlier in the day was more theoretical, but we always learn better when we immediately put it into practice. For more information on tree house zip lines, please click here: <http://www.treetopbuilders.net/tree-house-accessories/zip...>

Our Weekend Crew

We had a fantastic group for our first treehouse workshop. Most participants got to install their first garner limb over the weekend, some rode their first zip line ride, and all of them learned a lot and were glad they came.

We wish to extend our sincere thanks to everyone that attended the Tree Top Builders' Treehouse Workshop. For more information on this workshop, please click here:
