

Cell Phone Spyware Usage Steadily Increasing Between Spouses

National Cyber Security is the number one cyber security related reference and news portal. It is their vital mission to help secure not only the nation, but the world from cyber criminal threats being faced daily.

Aug. 9, 2010 - [PRLog](#) -- ATLANTA, GA- Aug 9, 2010—National Cyber Security (NCS), a cyber security reference and news portal website, has announced the availability of a nationwide interactive poll question asking the company's website visitors would they install spyware on their spouse's cell phones or computers.

According to HackerforHireUSA.com, the increase of spyware on a spouse's cell phone is on the rise. A couple statistics from Aladdin.com include; 15% of spyware threats send private information gathered from the end user currently logged on to the infected system, 25% percent of spyware sends information gathered from the victim's operating system, including the computer (host) name, domain name, logs of all processes running in memory, installed programs, security applications, client's internal IP address, and 69% of computers in homes with children under age 18 had spyware.

"It is illegal to install any type of surveillance software/hardware on anyone's cell phone or computer that they do not own," comments Gregory Evans, founder of National Cyber Security. "The only reason why spouses can get away with do so is if their name is listed on the cell phone account, or the computer is a family computer. They cannot install spyware on their spouse's business computer that is being paid for by the business, even if it is being used fulltime in the household."

About National Cyber Security
