New System Tool 2011 Virus Removal Tutorial Released By FastSpywareFixes.com

System Tool 2011 is a newly release fake antivirus program which has been designed by hackers to try and get you to buy the worthless upgrade to the program, as well as trying to steal your personal information. This new guide will show you how.

Nov. 10, 2010 - *[PRLog](#)* -- The System Tool 2011 virus is a common "fake antivirus" infection which has been released in late 2010 to try and get you to buy the false upgrade to the program whilst stealing your personal information. This virus is part of a growing number of rogue programs which will install themselves onto your PC and then cause a large number of issues for your system. Fortunately, if you have this virus, you can get rid of it by using the newly released tutorial on FastSpywareFixes.com

You can see how to get rid of System Tool 2011 by using the tutorial here:
http://www.fastspywarefixes.com/internet-security-fixes/system-tool-2011-removal-how-to-get-rid-of-system-tool-2011/

This virus is what's known as a "malware" infection. This stands for "malicious software", which means that it will install a rogue application onto your PC and then use this rogue to continually try and get you to buy the upgrade to the program. Although the virus may seem legitimate, it's actually a fake which is continually showing you false results as well as continually monitoring your Internet Access in an attempt to steal your personal information. If you have this virus on your PC, it's vital that you remove it in the most complete way possible - which can be done by deleting all the parts of the software that have installed itself onto your system.

The way to remove this virus is to first stop the program from running and then remove any part of the virus which is on your hard drive. Because this is a software tool, it will have placed a large number of fake infected files & settings onto your system to help it run. FastSpywareFixes.com recommends that you either use a reliable anti-malware application, or manually delete the files the program uses to run; thus stopping the application from loading up.

You can see exactly how to fix the System Tool 2011 infection by using the tutorial here:
