

## How To Sterilize Tattoo Supplies And Body Piercing Equipment

*The absolute cleaning and sterilization is extremely important for safety and health for both tattooers and tattooists. So sterilization supplies are necessary. Bleach, autoclave and ultrasonic cleaners are effective those sterilizing equipment.*

**Aug. 7, 2009** - [PRLog](#) -- Shenzhen, China – Tattoo body art has been popular for many years and gains more and more popularity. And body piercing is seen everywhere. As both are done by a special needle puncturing into certain flesh of human body, the opportunity for infection in any given tattoo is enormous though disposable tattoo and piercing needles and tubes are really available, and some people say that there is really no risk of exposure. The problem is that needles and tubes are not the only culprits in spreading disease. There are still so many other things and equipments which can be handled wrongly by an inexperienced person who hasn't been properly trained will cause infection and disease, such as, cross contamination. With that, we come to the realization that anyone, in-home or shop, absolutely must invest in tattoo sterilization supplies. What are these supplies? There are a few. And that'll be our subject today.

First, wash and soak in bleach. The risk of infection can be reduced by always cleaning tattoo supplies and body piercing equipment in bleach and water immediately after use and just before reuse. But bleach cleaning is not risk free, it is only an important tool for risk reduction. For it to be effective you must be consistent and careful in cleaning them. The process is troublesome and a waste of time and work and is not a suggested way as long as for urgent sterilizing but there is no other sterilization equipment.

Second, autoclave sterilization. Autoclave has been universally used for hospitals and tattoo parlors in the past and still now. This particular piece of equipment is smaller than a microwave, in most cases, and uses a process of heat, pressure, and steam to achieve sterilization. The autoclave process is fairly basic. Once a project is finished, the artist cleans his tools as best as he can with water. After that, they place them into a specially designed sterilization sensitive pouch. This pouch is then placed within the autoclave for a period of no less than 55 minutes. Most autoclaves have a 55-minute minimum setting. The tools are left in the autoclave until use.

Third, Ultrasonic cleaning. This is a new and most popular way of cleaning and sterilizing. It uses Ultrasonic waves and can obviously and completely clean the visible and invisible dirt and bacteria. Both professional and personal are available. From tattoo needles, tattoo ink, tattoo machines and tattoo guns to body piercing supplies, jewelry and equipment, all can be sterilized by an ultrasonic cleaner. In addition, it can be used for cleaning diamond jewelry, glasses, electronic components and even vegetables and fruits – Anything you can image to clean. This multifunctional ultrasonic cleaner is easy to handle and safer and faster.
