

Touch-free Access control solutions for a post-Covid-19 Environment

Automatic doors are an easy solution to help prevent the spread of germs and create touch-free access to places that customers and employees need to enter.

CHENNAI, India - Sept. 7, 2020 - [PRLog](#) -- Touch-free Access control solutions for a post-Covid-19 environment

No matter when you are allowed to or plan to reopen your business, preparing for that day is must. With discussions about how to create a safer and more hygienic experience for employees and customers, many businesses have begun to adapt by offering contactless pickup, touchless hand dryers in the bathroom, or having employees wear masks. But what about one of the most touched surfaces in places such as a public bathroom, offices, retail stores, and restaurants – the door handles. Automatic doors are an easy solution to help prevent the spread of germs and create touch-free access to places that customers and employees need to enter.

As companies take steps to resume normal operations and employees begin to enter the workplace once again, there is a real need for infection prevention and control in public and shared spaces. Effective procedures and protocols are essential, but there are also a number of physical solutions which can help reduce risk and exposure to Covid-19.

Touchless door release

Most access control doors need a 'request for exit' or door release button. Traditionally, this requires users to have physical contact with a push button, but new solutions offer contactless switch activation – touchless buttons activated by motion sensors.

Contactless Automatic Doors

Once the access point has been unlocked, automatic doors can be adopted to reduce risk of transmission from touching a contaminated door handle or push plate.

Automatic swing door or sliding door openers can be easily installed on a new or existing door is a quick and easy way to achieve touchless access control.

A retro fit kit will make the door open automatically on approach, or by simply waving your hand in front of a remote contactless pad. With Covid-19 this can stop the potential spread of contamination, as the user will not have to touch any parts to enter or exit a building.

Mobile access

Mobile access is not new in the industry but has gained a lot of traction in the last few months. Leading access control manufacturers provide mobile credential solutions which are safe, secure, convenient, and touchless.

Providing enhanced security and reduced risk of contamination, mobile credentials can also be deployed rapidly and maintained remotely, both advantages in the current environment.
